

EXP.NO: 2	Write JavaScript Programme to validate the following fields of the HTML Registration page.
DATE: 06/02/2025	

AIM:

To write JavaScript code to validate user input in a registration form. The validation will ensure that the data entered by the user meets specific criteria for each field. This will help in maintaining data integrity and prevent invalid submissions.

ALGORITHM:

1. Input:

- The user fills in the following fields: **First Name, Password, E-mail, Mobile Number, Last Name, and Address.**

2. Validation Steps:

1. Validate First Name:

- Check if the first name contains **only alphabets**.
- Ensure the length of the **First Name** is **at least 6 characters**.
- If any of these conditions fail, display an error message indicating the required input.

2. Validate Password:

- Check if the password is **at least 6 characters long**.
- If it is less than 6 characters, display an error message.

3. Validate E-mail:

- Use a **regular expression** to check if the email follows the standard pattern: `name@domain.com`.
- Ensure that the email contains **no invalid characters** and matches the required pattern.
- If it doesn't match, display an error message indicating an invalid email format.

4. **Validate Mobile Number:**

- o Check if the mobile number contains **exactly 10 digits**.
- o Ensure there are **no alphabets or special characters**.
- o If the number is invalid, display an error message indicating the correct format.

5. **Validate Last Name:**

- o Ensure the **Last Name** field is **not empty**.
- o If it is empty, display an error message.

6. **Validate Address:**

- o Ensure the **Address** field is **not empty**.
- o If it is empty, display an error message.
